Westline Carriers — TPMS Analysis Evidence

Appendix: Command Prompt execution screenshots supplied by the candidate

Evidence scope: These screenshots document script location checks, TPMS column inspection, a successful profiling run, and execution of the event-analysis script. They are execution evidence, not independent validation of the analytical conclusions.

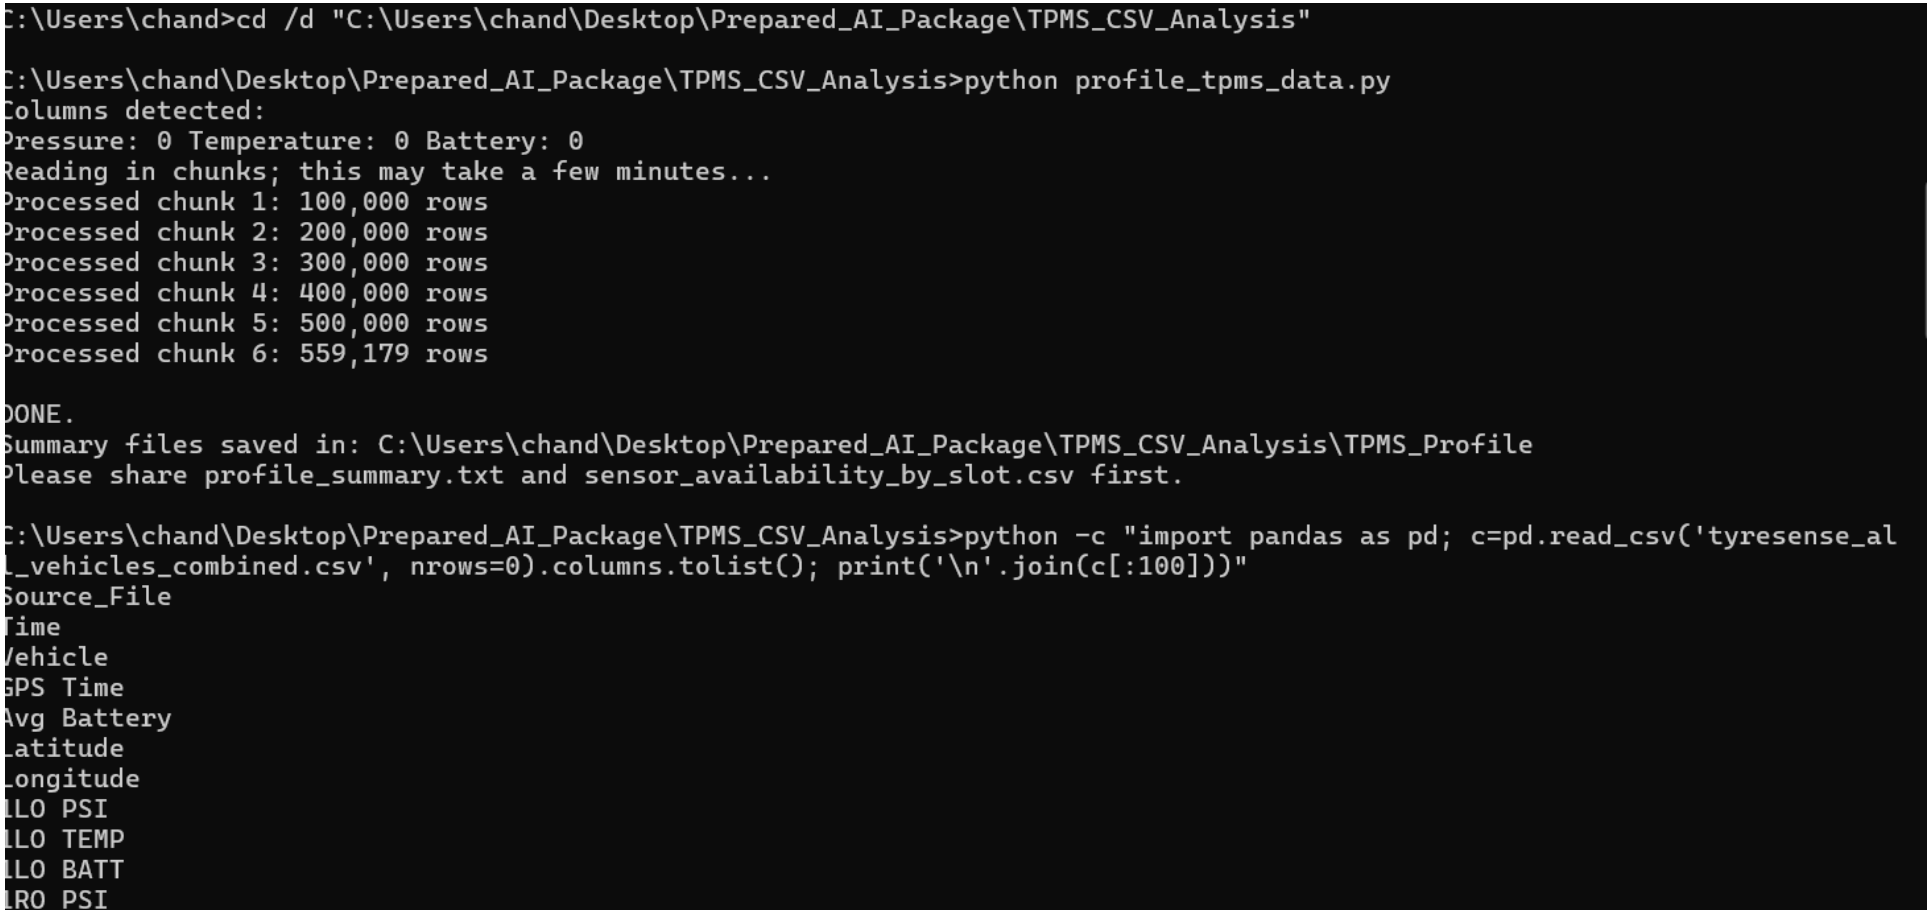

01 — Script location check

The command prompt shows the working directory and confirms the profiling script was found under the TPMS_CSV_Analysis folder. The initial checks in the user's home and Downloads folders returned "File Not Found"; the later directory check located the script.

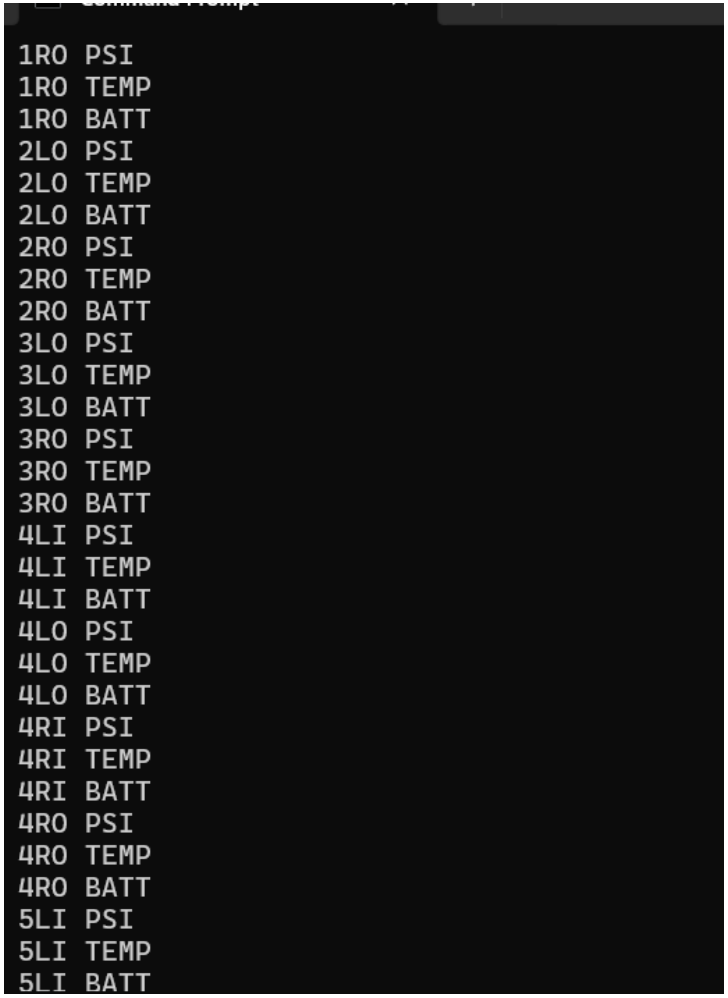

02 — Initial profiling attempt

This screenshot records an initial profiling run that reported zero detected pressure, temperature, and battery columns, despite processing 559,179 rows. This is an important intermediate result and should not be represented as the successful final profiling output.

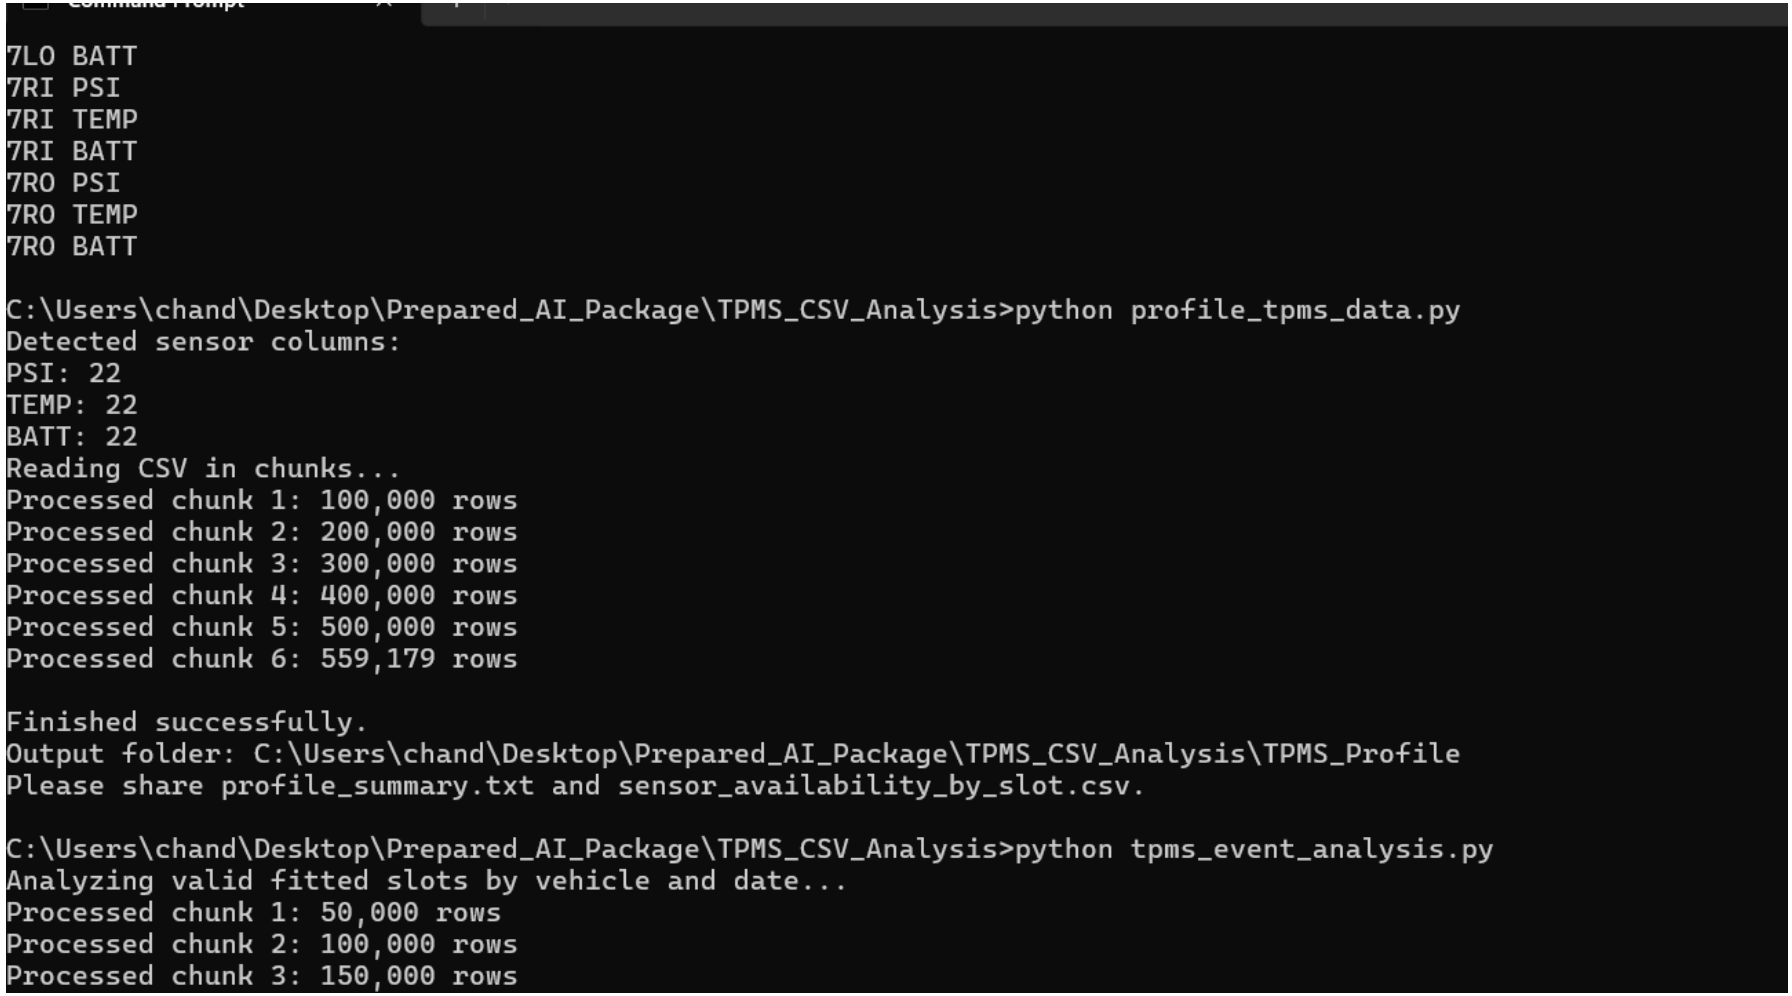

03 — Source column inspection

The displayed column list includes source metadata and sensor-slot fields such as PSI, TEMP, and BATT. It provides supporting evidence of the input schema inspected during troubleshooting.

04 — Successful profiling rerun and event-analysis start

The later profiling run reports 22 PSI, 22 TEMP, and 22 BATT sensor columns and processes 559,179 rows across six chunks. The screenshot also shows the event-analysis script beginning execution.

05 — Event-analysis completion

The event-analysis script processes 559,179 rows across 12 chunks and reports that its output files were saved: daily_pressure_profiles.csv, candidate_low_pressure_days.csv, and daily_dual_pressure_differences.csv. The script notes that cold-pressure targets are references and candidate flags require contextual review.
